Work Type FinalSite 2.Site Plan Review (Site Plans, CUP's, Planned Zones)

**Comments** The proposed use for 2900 S. National consists of a mixed-use office and high-performance computing ("HPC") data processing facility focused on computational research applications. The upper floor of the building will serve as the regional office headquarters for the management company overseeing and operating multiple HPC facilities throughout the Midwest. Office operations will include administrative functions, project management, engineering coordination, customer support, and remote monitoring of facilities. The basement level will be converted into a small-scale HPC and data processing facility designed to support computational research applications for various private and commercial clients. The facility will utilize advanced computer servers and related equipment to process large-scale datasets and modeling applications in a secure, self-contained environment. The cooling infrastructure for the HPC equipment will utilize a fully closed-loop chilled water system. This system continuously recirculates the same cooling water and does not require ongoing water consumption, discharge, or chemical byproducts as part of normal operations. Heat exchange will occur through a series of exterior dry coolers located outside the facility. These units will be screened from public view and surrounded by sound mitigation fencing to minimize visual and noise impacts on neighboring properties. The facility will also include backup and support infrastructure typical for modern computational facilities, including approximately 10-minute uninterruptible power supply (UPS) systems to protect equipment during short-term power interruptions, as well as coolant distribution units (CDUs) that circulate chilled coolant throughout the computing equipment. The operation is intended to function as a low-impact data processing use with no manufacturing, hazardous emissions, or industrial waste generated from the proposed application.
